VOLUNTARY ANNOUNCEMENT – FDA APPROVAL OF INVESTIGATIONAL NEW DRUG APPLICATION FOR PHASE II/III CLINICAL STUDY OF JS207 FOR THE NEOADJUVANT TREATMENT OF NSCLC PATIENTS

This announcement is made by Shanghai Junshi Biosciences Co., Ltd.* (上海君實生物醫藥科技股份有限公司) (the "**Company**") on a voluntary basis. Reference is also made to the overseas regulatory announcement of the Company dated 16 October 2025.

The board (the "**Board**") of directors (the "**Directors**") of the Company is pleased to announce that the investigational new drug application for an open-label, two-arm, randomized, active-controlled, phase II/III clinical study comparing the Company's product, recombinant humanized anti-PD-1/VEGF bispecific antibody (code: JS207), to nivolumab for the neoadjuvant treatment of patients with stage II/III, resectable, actionable genomic aberration (AGA)-negative, non-small cell lung cancer ("**NSCLC**") (the "**Study**") has been approved by the U.S. Food and Drug Administration (FDA).

ABOUT JS207

JS207 is a recombinant humanized anti-PD-1/VEGF bispecific antibody self-developed by the Company, mainly used for the treatment of advanced malignant tumors. JS207 can simultaneously bind to PD-1 and VEGFA with high affinity, effectively block the binding of PD-1 to PD-L1 and PD-L2, and inhibit the binding of VEGF to the its receptor. JS207 has the efficacy properties of both immunotherapeutic drugs and anti-angiogenic drugs. Through the neutralization of VEGF, JS207 inhibits the proliferation of vascular endothelial cells, improves the tumor microenvironment and increases the infiltration of cytotoxic T lymphocytes in the tumor microenvironment, thereby achieving better anti-tumor activity.

JS207 is designed based on the high-affinity, clinically proven and differentiated anti-PD-1 drug toripalimab as the backbone. The anti-PD-1 moiety of JS207 adopts a Fab structure to maintain binding affinity to PD-1 and thereby attain better enrichment in the tumor microenvironment. The anti-VEGF moiety has a binding affinity for human vascular endothelial growth factor that is comparable to that of bevacizumab. In non-clinical in vitro cytological tests, compared with the combination of an anti-PD-1/PD-L1 monoclonal antibody and a VEGF monoclonal antibody, a bispecific antibody simultaneously targeting PD-1/PD-L1 and VEGF demonstrated significantly enhanced PD-1 antigen binding and internalization, and synergistic enhancement of the NFAT signaling pathway, thereby better activating immune cells in the tumor microenvironment.

As of the date of this announcement, JS207 has been approved for conducting phase II/III clinical study, while multiple phase II clinical studies are underway to explore its combination with chemotherapy, monoclonal antibodies, antibody-drug conjugates (ADCs) and other drugs in NSCLC, colorectal cancer, triple-negative breast cancer, liver cancer and other tumor types.

ABOUT THE STUDY

Lung cancer is currently a malignant tumor with the highest prevalence and mortality rate in the world. According to GLOBOCAN 2022 statistics, there were approximately 2.48 million new lung cancer cases and approximately 1.82 million lung cancer deaths worldwide in 2022. NSCLC is a major subtype of lung cancer, accounting for approximately 85% of all cases. Amongst these patients, 20%-25% are surgically resectable at first diagnosis, but even after radical surgical treatment, 30%-55% of these patients suffer from post-surgical recurrence and death. Currently, immune checkpoint inhibitors represented by anti-PD-1 monoclonal antibodies combined with chemotherapy have been widely used in the perioperative treatment of resectable NSCLC, and shows significant improvements in event-free survival (EFS), pathological complete response (pCR), and overall survival (OS), but there remains unmet clinical needs in terms of patient survival and cure rates for resectable NSCLC patients.

The study is an open-label, two-arm, randomized, active-controlled, international multi-center phase II/III clinical study comparing the efficacy and safety of JS207 to nivolumab for the neoadjuvant treatment of patients with stage II/III, resectable, actionable genomic aberration (AGA)-negative NSCLC. The study is the first PD-1/VEGF dual-target drug approved for conducting confirmatory study in patients eligible for surgery, and Professor Wu Yilong* (吳一龍) from Guangdong Provincial People's Hospital* (廣東省人民醫院) will be the principal investigator.

RISK WARNING

Due to the high-tech, high-risk, and high value-added characteristics of pharmaceutical products, there are significant risks and uncertainties in the research, development, and commercialization processes of drugs. These multiple stages are susceptible to various uncertain factors. Investors are advised to make cautious decisions and pay careful attention to investment risks. The Company will actively pursue the described project and fulfill its information disclosure obligations in a timely manner for subsequent progress in strict compliance with relevant regulations.

By Order of the Board
Shanghai Junshi Biosciences Co., Ltd.*
Mr. Xiong Jun
Chairman

Shanghai, the PRC, 16 October 2025

As at the date of this announcement, the Board of the Company comprises Mr. Xiong Jun, Dr. Li Ning, Dr. Zou Jianjun, Mr. Li Cong, Mr. Zhang Zhuobing, Dr. Yao Sheng, Dr. Wang Gang and Dr. Li Xin as executive Directors; Mr. Tang Yi as a non-executive Director; and Mr. Zhang Chun, Dr. Feng Xiaoyuan, Mr. Li Zhongxian, Ms. Lu Kun and Dr. Yang Jin as independent non-executive Directors.
